

METHOD FOR PREVENTING RECURRING VENOUS THROMBOEMBOLISM
USING LONG-TERM LOW-INTENSITY WARFARIN

ABSTRACT OF THE DISCLOSURE

- 5 A method is provided for inhibiting, preventing or reducing the incidence of venous thromboembolism (VTE) in a patient who previously has undergone standard therapy for VTE, that is, a dose of warfarin of 2 to 3 INR over a 3 to 12 month period, wherein the patient is administered a low dose of warfarin of less than 2 INR and preferably from about 1.4 to less than 2 INR over an extended period of time.
